<center>Final Project Report</center>
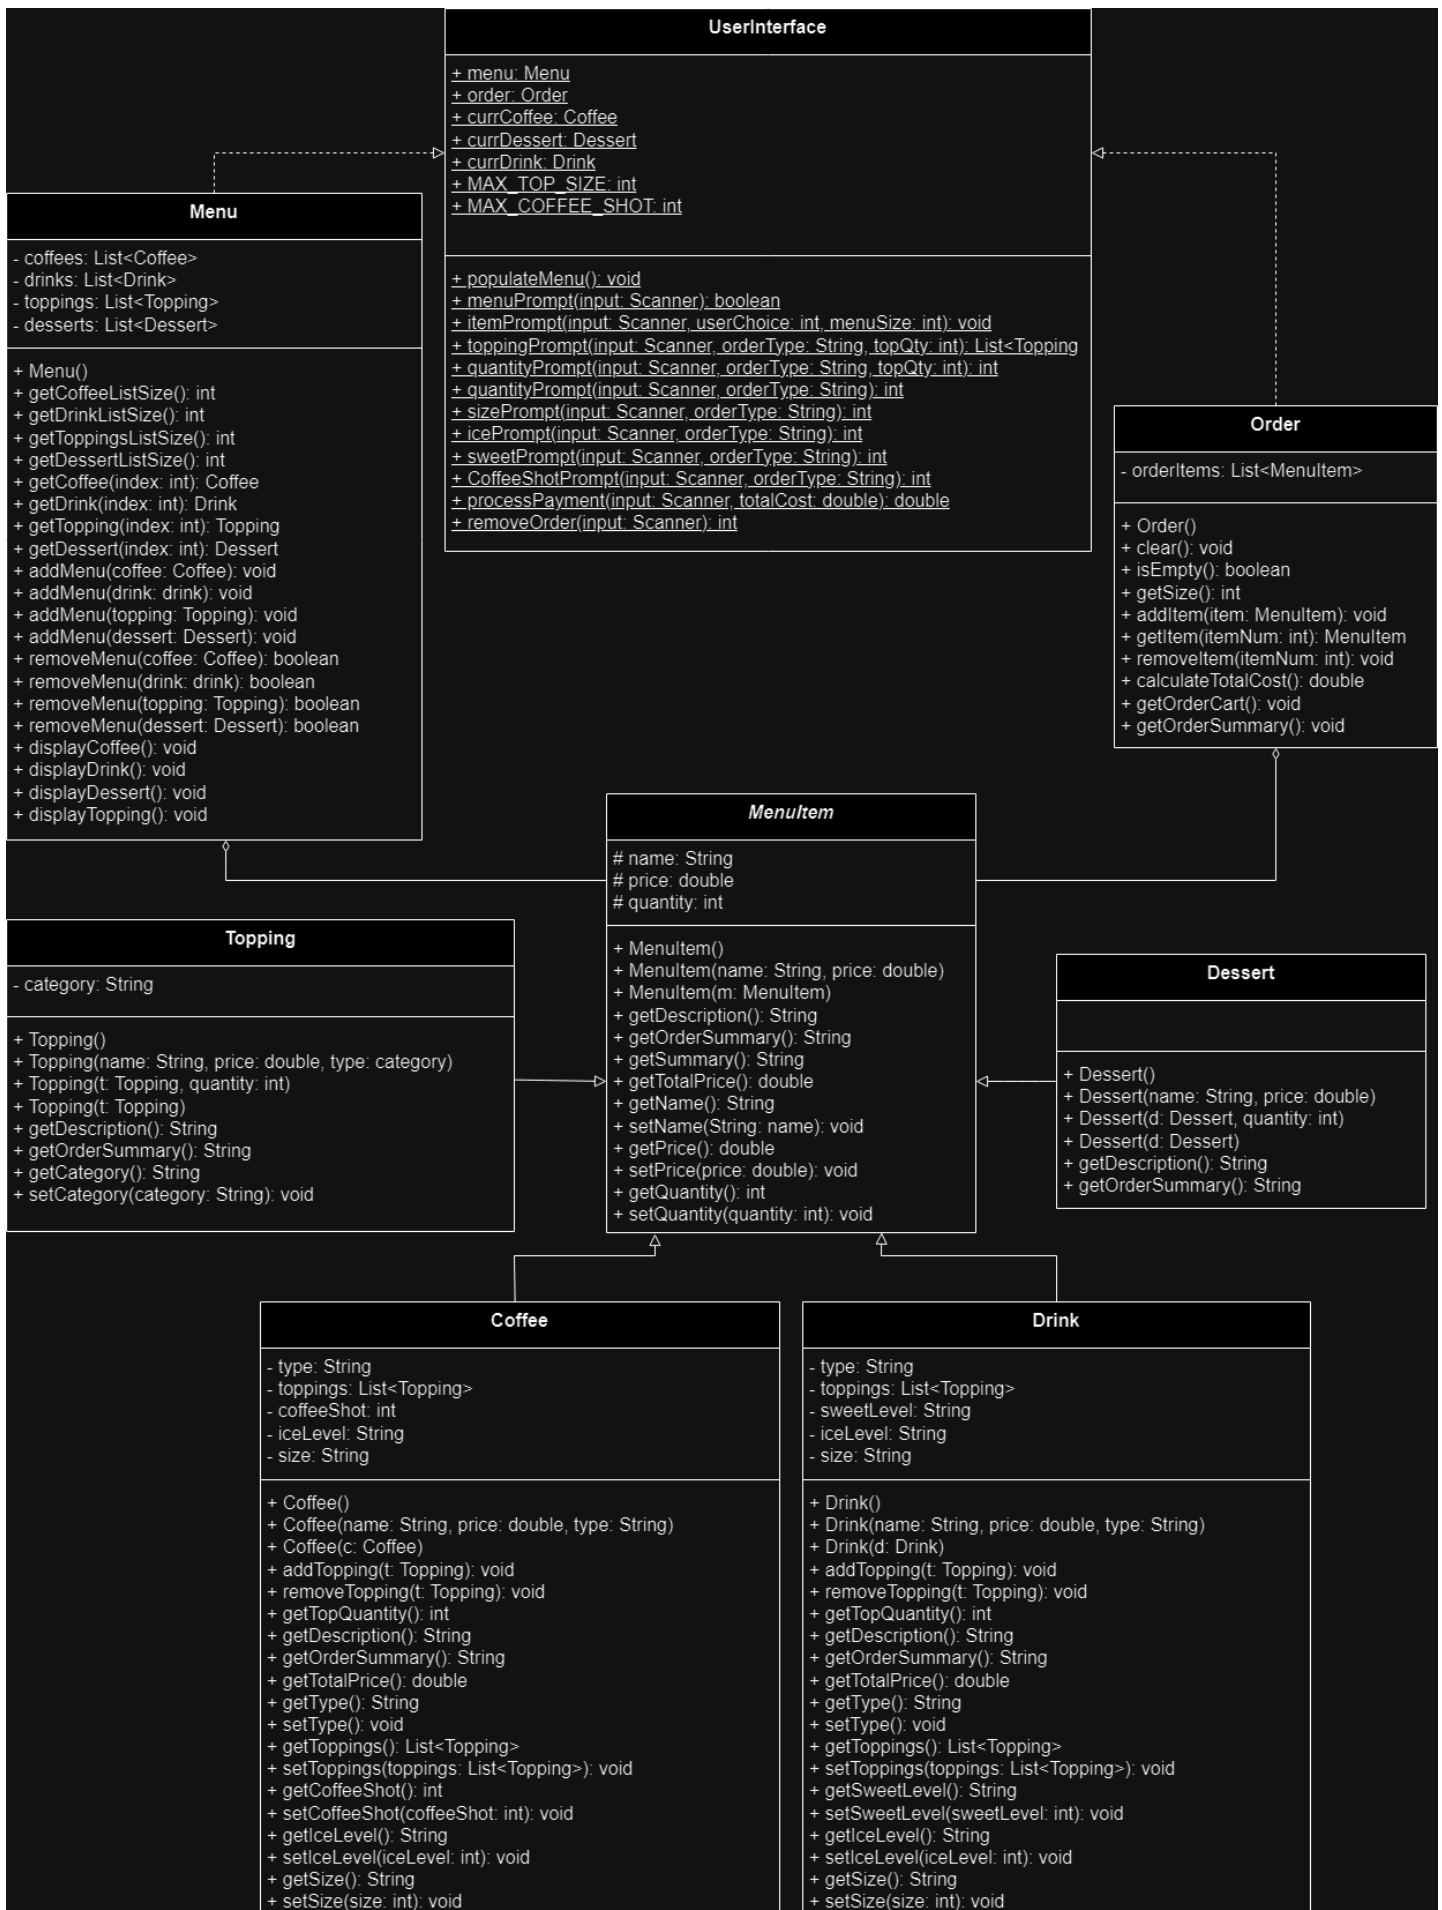

Project Introduction:

The project is a Java-based application designed to simulate a café ordering system. It encompasses various classes that represent different aspects of a café menu, including drinks (like coffee and other beverages), desserts, toppings, and a system to handle customer orders. The application is structured in an object-oriented manner, with a clear division of responsibilities among different classes. This structure allows for easy management and modification of the menu items and orders.

Objective:

The primary objective of this project is to create a user-friendly, efficient, and scalable café ordering system. The system aims to facilitate easy addition, modification, and removal of menu items, as well as efficient handling of customer orders. The project also seeks to demonstrate the principles of object-oriented programming, such as class inheritance, encapsulation, and polymorphism, in a real-world application scenario.
